About the speaker

- Using + playing with Linux since 1994
- Kernel / bootloader / driver / firmware development since 1999
- IT security expert, focus on network protocol security
- Core developer of Linux packet filter netfilter/iptables
- Board-level Electrical Engineering
- Always looking for interesting protocols (RFID, DECT, GSM)

The closed GSM industry Security implications The GSM network The GSM protocols

GSM/3G protocol security

Observation

- Both GSM/3G and TCP/IP protocol specs are publicly available
- The Internet protocol stack (Ethernet/Wifi/TCP/IP) receives lots of scrutiny
- GSM networks are as widely deployed as the Internet
- Yet, GSM/3G protocols receive no such scrutiny!
- There are reasons for that:
 - GSM industry is extremely closed (and closed-minded)
 - Only about 4 closed-source protocol stack implementations
 - GSM chipset makers never release any hardware documentation

イロト イポト イヨト イヨト

The closed GSM industry Security implications The GSM network The GSM protocols

The closed GSM industry

Handset manufacturing side

- Only very few companies build GSM/3.5G baseband chips today
 - Those companies buy the operating system kernel and the protocol stack from third parties
- Only very few handset makers are large enough to become a customer
 - Even they only get limited access to hardware documentation
 - Even they never really get access to the firmware source

The closed GSM industry Security implications The GSM network The GSM protocols

The closed GSM industry

Network manufacturing side

- Only very few companies build GSM network equipment
 - Basically only Ericsson, Nokia-Siemens, Alcatel-Lucent and Huawei
 - Exception: Small equipment manufacturers for picocell / nanocell / femtocells / measurement devices and law enforcement equipment
- Only operators buy equipment from them
- Since the quantities are low, the prices are extremely high
 - e.g. for a BTS, easily 10-40k EUR

The closed GSM industry Security implications The GSM network The GSM protocols

The closed GSM industry Operator side

- Operators are mainly banks today
- Typical operator outsources
 - Network planning / deployment / servicing
 - Even Billing!
- Operator just knows the closed equipment as shipped by manufacturer
- Very few people at an operator have knowledge of the protocol beyond what's needed for operations and maintenance

The closed GSM industry Security implications The GSM network The GSM protocols

GSM is more than phone calls

Listening to phone calls is boring...

- Machine-to-Machine (M2M) communication
 - BMW can unlock/open your car via GSM
 - Alarm systems often report via GSM
 - Smart Metering (Utility companies)
 - GSM-R / European Train Control System
 - Vending machines report that their cash box is full
 - Control if wind-mills supply power into the grid
 - Transaction numbers for electronic banking

< □ > < 同 > < 三 > <

The closed GSM industry Security implications The GSM network The GSM protocols

The closed GSM industry

Security implications

The security implications of the closed GSM industry are:

- Almost no people who have detailed technical knowledge outside the protocol stack or GSM network equipment manufacturers
- No independent research on protocol-level security
 - If there's security research at all, then only theoretical (like the A5/2 and A5/1 cryptanalysis)
 - Or on application level (e.g. mobile malware)
- No open source protocol implementations
 - which are key for making more people learn about the protocols
 - which enable quick prototyping/testing by modifying existing code

The closed GSM industry Security implications The GSM network The GSM protocols

The closed GSM industry

My self-proclaimed mission

Mission: Bring TCP/IP/Internet security knowledge to GSM

- Create tools to enable independent/public IT Security community to examine GSM
- Try to close the estimated 10 year gap between the state of security technology on the Internet vs. GSM networks
 - Industry thinks in terms of *walled garden* and *phones* behaving like specified
 - No proper incident response strategies!
 - No packet filters, firewalls, intrusion detection on GSM protocol level
 - General public assumes GSM networks are safer than Internet

The closed GSM industry Security implications The GSM network The GSM protocols

The closed GSM industry

Areas of interest for Security research

- Specification problems
 - Encryption optional, weak and only on the Um interface
 - Lack of mutual authentication
 - Silent calls for pin-pointing a phone
 - RRLP and SUPL to obtain GPS coordinates of phone
- Implementation problems
 - TMSI information leak on network change
 - TLV parsers that have never seen invalid packets
 - Obscure options in spec lead to rarely-tested/used code paths
- Operation problems
 - VLR overflow leading to paging-by-IMSI
 - TMSI re-allocation too infrequent
 - Networks/Cells without frequency hopping

The closed GSM industry Security implications The GSM network The GSM protocols

Security analysis of GSM How would you get started?

If you were to start with GSM protocol level security analysis, where and how would you start?

- On the handset side?
 - Difficult since GSM firmware and protocol stacks are closed and proprietary
 - Even if you want to write your own protocol stack, the layer 1 hardware and signal processing is closed and undocumented, too
 - Publicly known attempts
 - The TSM30 project as part of the THC GSM project
 - mados, an alternative OS for Nokia DTC3 phones
 - none of those projects successful so far

・ロト ・回ト ・ヨト ・ヨト

The closed GSM industry Security implications The GSM network The GSM protocols

Security analysis of GSM How would you get started?

If you were to start with GSM protocol level security analysis, where and how would you start?

- On the network side?
 - Difficult since equipment is not easily available and normally extremely expensive
 - However, network is very modular and has many standardized/documented interfaces
 - Thus, if BTS equipment is available, much easier/faster progress

イロト イポト イヨト イヨト

The closed GSM industry Security implications The GSM network The GSM protocols

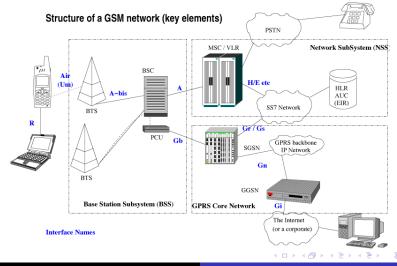

Security analysis of GSM

- Read GSM specs (> 1000 PDF documents) ;)
- Gradually grow knowledge about the protocols
- Obtain actual GSM network equipment (BTS)
- Try to get actual protocol traces as examples
- Start a complete protocol stack implementation from scratch
- Finally, go and play with GSM protocol security

イロト イポト イヨト イヨト

The closed GSM industry Security implications The GSM network The GSM protocols

The GSM network

Harald Welte OpenBSC network-side GSM stack

The closed GSM industry Security implications The GSM network The GSM protocols

GSM network components

- The BSS (Base Station Subsystem)
 - MS (Mobile Station): Your phone
 - BTS (Base Transceiver Station): The cell tower
 - BSC (Base Station Controller): Controlling up to hundreds of BTS
- The NSS (Network Sub System)
 - MSC (Mobile Switching Center): The central switch
 - HLR (Home Location Register): Database of subscribers
 - AUC (Authentication Center): Database of authentication keys
 - VLR (Visitor Location Register): For roaming users
 - EIR (Equipment Identity Register): To block stolen phones

・ロト ・回ト ・ヨト ・ヨト

The closed GSM industry Security implications The GSM network The GSM protocols

GSM network interfaces

- Um: Interface between MS and BTS
 - the only interface that is specified over radio
- A-bis: Interface between BTS and BSC
- A: Interface between BSC and MSC
- B: Interface between MSC and other MSC

GSM networks are a prime example of an asymmetric distributed network, very different from the end-to-end transparent IP network.

Getting started Timeline OpenBSC

Implementing GSM protocols How I got started!

- In 2006 I bought an old BTS (Siemens BS-11) on eBay
 - This is 48kg GSM900 BTS with 2 TRX at 2W output power (each)
 - I didn't have much time at the time (day job at Openmoko)
 - Started to read up on GSM specs whenever I could
 - Bought a HFC-E1 based PCI E1 controller, has mISDN kernel support
 - Found somebody in the GSM industry who provided protocol traces
- In September 2008, we were first able to make the BTS active and see it on a phone

ヘロト 人間 ト ヘヨト ヘヨト

Getting started Timeline OpenBSC

Implementing GSM protocols

- November 2008: I started the development of OpenBSC
- December 2008: we did a first demo at 25C3
- January 2009: we had full voice call support
- Q1/2009: Add support for ip.access nanoBTS
- June 2009: I started with actual security related stuff
- August 2009: We had the first field test with 2BTS and > 860 phones
- Q1/2010: The first 25 OpenBSC instances running in a commercial network

ヘロト ヘアト ヘビト ヘビト

Getting started Timeline OpenBSC

Security analysis of GSM

What is OpenBSC

- A GSM network in a box software
- Implements minimal subset of BSC, MSC, HLR, SMSC
- Is Free and Open Source Software licensed under GNU GPL
- Supports Siemens BS-11 BTS (E1) and ip.access nanoBTS (IP based)
- Has classic 2G signalling, voice and SMS support
- Implements various GSM protocols like
 - A-bis RSL (TS 08.58) and OML (TS 12.21)
 - TS 04.08 Radio Resource, Mobility Management, Call Control
 - TS 04.11 Short Message Service

ヘロト 人間 ト ヘヨト ヘヨト

Getting started Timeline OpenBSC

Security analysis of GSM

OpenBSC features

- Run a small GSM network with 1-n BTS and OpenBSC
- No need for MSC/HLR/AUC/...
- No need for your own SIM cards
- Establish signalling channels
- Make incoming and outgoing voice calls between phones
- Send/receive SMS between phones
- Connect to ISDN PBX or public ISDN via Linux Call Router
- Telnet console with Cisco-style interface

ヘロト ヘアト ヘビト ヘビト

Theory Observations GSM Protocol Fuzzing

Known GSM security problems

Scientific papers, etc

- No mutual authentication between phone and network
 - leads to rogue network attacks
 - leads to man-in-the-middle attacks
 - is what enables IMSI-catchers
- Weak encryption algorithms
- Encryption is optional, user does never know when it's active or not
- DoS of the RACH by means of channel request flooding
- RRLP (Radio Resource Location Protocol)
 - the network can obtain GPS fix or even raw GSM data from the phone
 - combine that with the network not needing to authenticate
 itself

Theory Observations GSM Protocol Fuzzing

Interesting observations Learned from implementing the stack

While developing OpenBSC, we observed a number of interesting

- Many phones use their TMSI from the old network when they roam to a new network
- Various phones crash when confronted with incorrect messages. We didn't even start to intentionally send incorrect messages (!)
- There are tons of obscure options on the GSM spec which no real network uses. Potential attack vector by using rarely tested code paths.

・ロト ・ 同 ト ・ ヨ ト ・ ヨ ト

1

Theory Observations GSM Protocol Fuzzing

GSM Protocol Fuzzing

How to do GSM protocol fuzzing

- From the handset to the network
 - Basically impossible due to closeness of baseband
 - However, some incomplete projects working on it
- From the network side
 - Easy in case of rogue network attacks
 - Fuzzing target is the GSM stack in the baseband processor
- As an A-bis man in the middle
 - Needs access to an A-bis interface of an actual network
 - Very attractive, since no encryption and ability to fuzz both network and handset

ヘロン 人間 とくほ とくほ とう

1

Theory Observations GSM Protocol Fuzzing

A-bis injection

for A-bis over IP

How to do inject messages into A-bis over IP?

- Problem
 - A-bis/IP uses one TCP connection for OML and RSL messages
 - OML initialization is essential for BTS to become operational
 - TCP makes insertion of additional messages relatively hard
- Solution: Build an A-bis injection proxy
 - Transparently pass OML and RSL packets between BTS and BSC
 - Add additional stateless UDP sockets for injecting messages, one socket each for
 - injecting OML/RSL to the network
 - injecting OML/RSL to the BTS

ヘロン 人間 とくほ とくほ とう

Theory Observations GSM Protocol Fuzzing

A-bis Injection Proxy Principle of operation

- Proxy needs to be brought between BTS and BSC
- Luckily, A-bis/IP SSL support not always used
- Thus, physical access to the Ethernet link sufficient
- Configure system with two interfaces
 - BSC-facing interface has IP of BTS
 - BTS-facing interface has IP of BSC / default gw
- BTS will make TCP connection to proxy
- proxy will make independent TCP connection to BSC

ヘロト ヘアト ヘビト ヘビト

Theory Observations GSM Protocol Fuzzing

scapy GSM support

How to actually craft the packets for the fuzzing

- GSM has many, many protocols
- Writing custom code will be a hard-coded special case for each of them
- Solution: Use scapy and implement the GSM protocols as scapy Layers
 - IPA protocol header
 - RSL protocol layer
 - RLL data indication / data request
 - GSM 04.08 RR / MM / CC messages

ヘロト 人間 ト ヘヨト ヘヨト

Theory Observations GSM Protocol Fuzzing

OpenBSC silent calls

A more elegant fuzzing interface

- Injection at the A-bis level has many problems
 - you can only do it while a call is active
 - you simply piggy-back on existing RR connections
- The OpenBSC silent call feature can help
 - we use OpenBSC to establish a RR connection
 - in the GSM master/slave model, the phone will not close a connection unless told to do so
 - we then send arbitrary data to the phone and receive its responses
 - this currently only works from within OpenBSC, but we'll provide UDP injection sockets soon

ヘロト ヘアト ヘビト ヘビト

What we've learned Where we go from here Where we go from here Further Reading

- The GSM industry is making security analysis very difficult
- It is well-known that the security level of the GSM stacks is very low
- We now have multiple solutions for sending arbitrary protocol data
 - From a rogue network to phones (OpenBSC, OpenBTS)
 - From an A-bis proxy to the network or the phones

イロト イポト イヨト イヨト

GSM/3G security What we've learned Implementing GSM protocols Security analysis Where we go from here Summary Further Reading

- The tools for fuzzing mobile phone protocol stacks are available
- It is up to the security community to make use of those tools (!)
- Don't you too think that TCP/IP security is boring?
- Join the GSM protocol security research projects
- Boldly go where no man has gone before

What we've learned Where we go from here Where we go from here Further Reading

Current Areas of Work / Future plans

- OsmoSGSN/OpenGGSN: Packet data (GPRS/EDGE) support
 - GPRS/EDGE is used extensively on modern smartphones
 - Enables us to play on IP level with those phones without a heavily filtered operator network
 - Status: Already functional, but very fragile/incomplete. 1-2 more months
- UMTS(3G) support in OpenBSC
- Playing with SIM Toolkit from the operator side
- Playing with MMS
- More exploration of RRLP + SUPL

GSM/3G security What we've learned Implementing GSM protocols Where we go from here Security analysis Where we go from here Summary Further Reading
